

REAL TIME MONITORING OF RAIL AND EQUIPMENT

IntelliTrack® Technology Monitors System Condition and Maintenance Practices

IntelliTrack is real time track and rail equipment monitoring technology developed by Salient Systems, an L.B. Foster business unit. This innovative system can detect component failures that cause catastrophic track and vehicle damage. IntelliTrack Technology allows the railroad to monitor vehicle condition, such as static and dynamic weights, lateral instability, curving performance, overloads, imbalanced load and wheel defects. IntelliTrack systems also monitor rail for friction management feedback, heat related track buckles and cold temperature rail breaks.

IntelliTrack® Technology

- Wheel Impact Load Detector
- Weigh In Motion System
- Truck Hunting Detector
- Wireless Friction Management Feedback Controls
- Wireless L/V Monitors
- RailStress Monitors
- Tribometer
